This KM explains why you might receive an error saying "wmms0002 no record found for past inputs" when saving move request or trying to complete a process.

End User Solution

This happens when there is not sufficient inventory in the storage location to complete the transaction. For example, the user is trying to complete the refurbishment via the workorder refurbishment process and there is insufficient inventory of that item in the refurb location. This could be for the item being refurbed or the inventory being consumed for refurbishment.

Another way this can happen is if the user enters the incorrect UOM for the item when creating a move request

If after correcting any of these solutions and the error is still displays, the user needs to contact the HD and the ticket needs to be escalated to the ICBS SME.
